ABSTRACTED-PUB-NO: JP 74029902B  
BASIC-ABSTRACT:

A molten polymer of thermoplastic resin containing a foaming substance is extruded through a die with slits and subjected to quench drawing to form coloured fibrous sheet which has numerous non-continuous cracks in 1 direction >=2 of the sheets are laid one on top of the other in the same crack direction and then spread at right angles to the crack direction to form meshy sheet (I). White or light coloured meshy sheet (II) which is produced in the same way as (I) and has a m.pt (I), is laid over (I) in the same fibre direction. The 2 meshy sheets are stuck together under press at a temp. The m.pt of (II) by using embossing plate or roller so that films are formed at the convex parts of the pattern mold and the colour of the lower sheet comes up to the surface. The space between the cracks of the fibrous sheet should be as small as possible and the cracks should pref be uniform in shape, size and distribution. The polymers used are e.g. polystyrene, polyethylene, polypropylene, poly-epsilon-capro-lactam, polyhexamethylene adipamide, polyethylene terephthalate, polyethylene 2,6 naphthalate, polyvinyl chloride, polyvinylidene chloride, polycarbonate, acrylic resin, copolymers and mixtures. The foaming substances are (1) gases which are inert to the molten polyer e.g. as N carbonic acid gas and He (2) volatile org liqs e.g. butane propane and (3) foaming agents such as azodicarboxylic amide and ptoluene sulphonyl semicarbazide.
